1.2. Document Generation

A purchase order document can be originated from a material requirement or created manually by the user.

In the following example it is possible to analyze a purchase order generation from a material requirement.

Figure 2 – Purchase generation from material requirement

These requisitions are generated based on material needs (through the MRP/need analysis process), by the Manufacturing Orders or simply manually.

After a material requirement confirmation, the system generates a purchase order document.

1.3. Document Structure

A purchase order document is composed by four main tabs, which are:

- ✓ Document identification
- ✓ Supplier data
- ✓ Details
- ✓ Values

Figure 3 – Purchase order screen structure

On the first tab the system returns the series and document code number, the document date and actual status.

On the second tab "Supplier data" must be all supplier information, but as mandatory only supplier number and currency.

On purchase order details must be defined all the order lines and delivery plans.

On purchase values tab, the system returns the gross, net, vat and discount values and percentages.

If a purchase order is originated by a requirement material document, the system returns the requirement document identification.

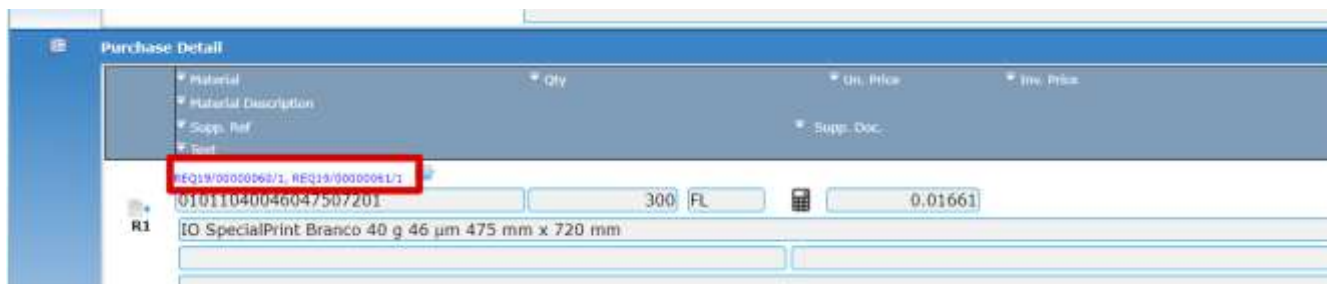

Figure 4 – Material requirement link in purchase

While the user is filling in the purchase document lines, the system validates if exists a defined supplier catalog for the product.

If there is a link between the product and the supplier's catalog, the system applies the catalog price and the corresponding purchase unit of measurement (if defined in the catalog).

Supplier references and descriptions that are defined in the catalog are also visible in the purchase document line.

Figure 5 – Supplier catalog

If the material to purchase has some order stock rules defined (values different from zero), a new popup is returned in purchase order creation with the values defined in that rule. This list returns values defined for minimum/maximum order quantity, fixed order quantity and multiple order quantity.

Figure 7 – Purchase order values

After defining the purchase lines, it is possible to distribute the delivery plan for each line of the document.

Here the scheduled delivery dates and the respective delivery quantities are defined.

The screenshot displays the SisTrade software interface. At the top, the title bar shows 'SisTrade - Software Consulting S.A.' and the user 'admin'. The main window is titled 'Purchase Order - Distribution Plan'. It contains a header section with fields for 'Series/Code', 'Status/Date', and 'Customer'. Below this is a table with columns 'Quantity' and 'Total'. The 'Quantity' column has a value of '30' and the 'Total' column has a value of '30'. The 'Status/Date' field shows 'A' and '2021-10-22'. The 'Customer' field shows 'F0001'. Below the table is a section titled 'Delivery Plan'. It contains a table with columns 'Date', 'Request Qty', 'Received Qty', and 'Destination'. The first row is highlighted and contains the following data: '2021-10-22', '30', '0', and 'Warehouse Offset'. The 'Destination' field is further detailed with 'PROT14/00000161' and 'Pre-Press Challenges Dark Grey 300g'. The 'Request Qty' field is set to '30' and the 'Received Qty' field is set to '0'. The 'Destination' field is set to 'Warehouse Offset'.

Figure 8 – Purchase order delivery plan

The user may check the confirmed deliveries with supplier, in order to send this information to the stock management department.

After saving the purchase order the user changes the document status and the next step depends of the defined workflow.

1.4. Workflow

There is no mandatory an existence of purchase workflow. In that case, the purchase is automatically approved and sent to supplier.

If there is an approval workflow, the first step of approval validation is the user budget and if the purchase amount is within the user's budget, the system allows the document approval. Otherwise, the document is in pending approval status until the purchase manager reviews the document and approves or rejects it.

There is also the possibility of setting a second approval level, which is carried out after the first approval (by purchase manager) and is usually reviewed by the administration.

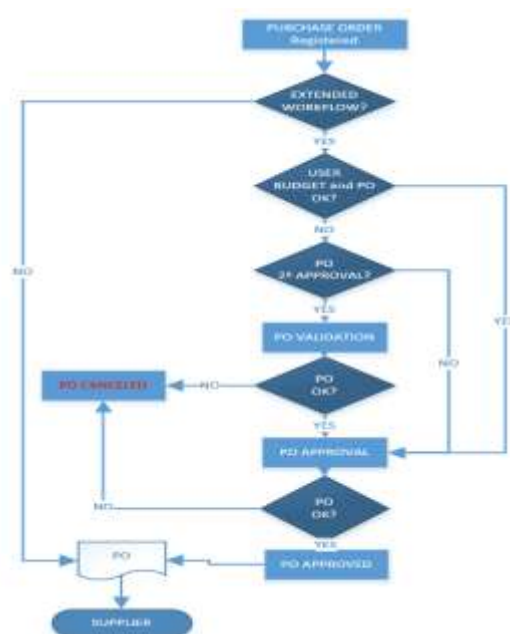

Figure 9 – Purchase orders approval workflow

1.4.1. Purchase Orders Validation

In order to review a purchase, the user should access the menu option Procurement > Purchases > Purchase Order Validation.

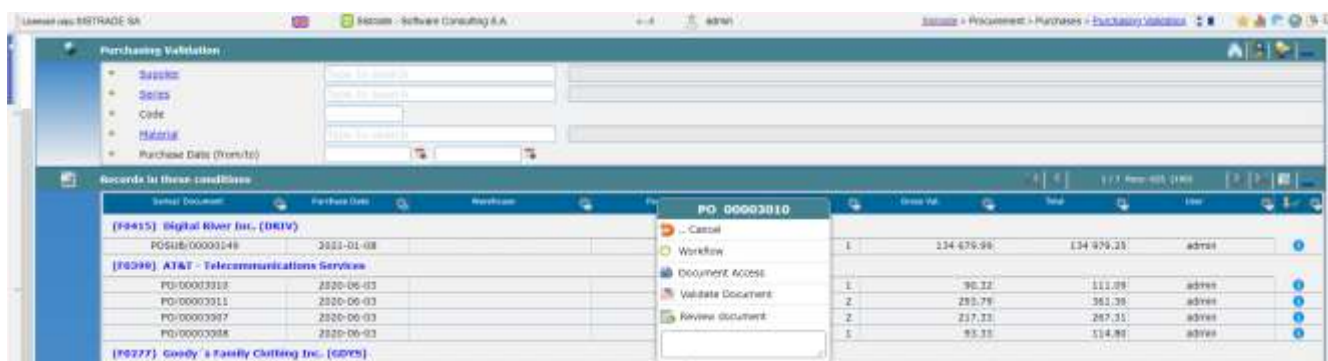

Figure 10 – Purchase validation

- 1 – Click over the line of purchase.
- 2– Click if needed to check the workflow of the purchase.
- 3 – Click to enter in purchase document
- 4 – Click to validate the purchase document, clicking in this option will change the status of purchase order from R - Registered to D – Pending approval.
- 5 – Click to review document, if the purchase order is not ok. This action will change the purchase order status to S – Under revision.

1.4.2. Purchase Orders Approval

To finalize the purchase order workflow and send the purchase order to supplier (if the second approval workflow is configured), the user should access the menu option Procurement > Purchases > Purchase Order Approval.

Figure 11 – Purchase approval

- 1 – Click over the line of purchase.
- 2 – Click if needed to check the workflow of the purchase.
- 3 – Click to enter in purchase document
- 4 – Click to validate the purchase document, clicking in this option will change the status of purchase order from D – Pending approval to A - Approved. After this approval it will be possible to send the purchase order to supplier.
- 5 – Click to review document, if the purchase order is not ok. This action will change the purchase order status to S – Under revision.

After a purchase approval, the requested material or service remains available for reception. According to the requested material type, the system allows to register one of two possible documents: Material Reception or Purchase reception (services).

1.5. Scheduled Deliveries

The step before material reception is the analysis on scheduled deliveries. That is, regarding all the purchase orders, what are the pending material to receive? By accessing the menu option: Sistrade > Stocks> Material Reception> Scheduled deliveries, the system returns a list of the deliveries pending of reception.

Document	Date	Amount	Unit	Material	Qty	Pending Qty	Quantity to confirm	Unit	Delivery Date
PD 00003035/1	2020-07-23	600		30-0 Branco Transparente UV	0.004	0.004	0.000	TON	2020-07-23
PD 00003036/1	2020-07-25	600		30-0 Branco Transparente UV	0.003	0.000	0.000	2T	2020-07-23

Here its possible to access purchase order delivery plans, in order to change delivery dates, confirm delivery dates, etc.

The next step is the print on purchase delivery plans barcodes, in order to send it to warehouse or it can be accessible directly from material reception option.

The printing of the schedule delivery plans has the function to be the starting point for the warehouse head to control and register the received material from the suppliers. For this reason, the listing provided by Sistrade allows a fast way to process the entry of material in system, through the use of optical reading.

Therefore, the scheduled deliveries prints available in this screen are the following:

1.6. Service Reception

This type of material reception is associated with purchase services or material that doesn't have stock control. To register this type of movements in the system, the user must access the menu option:

Sistrade > Stocks > Materials Reception > Purchases Reception

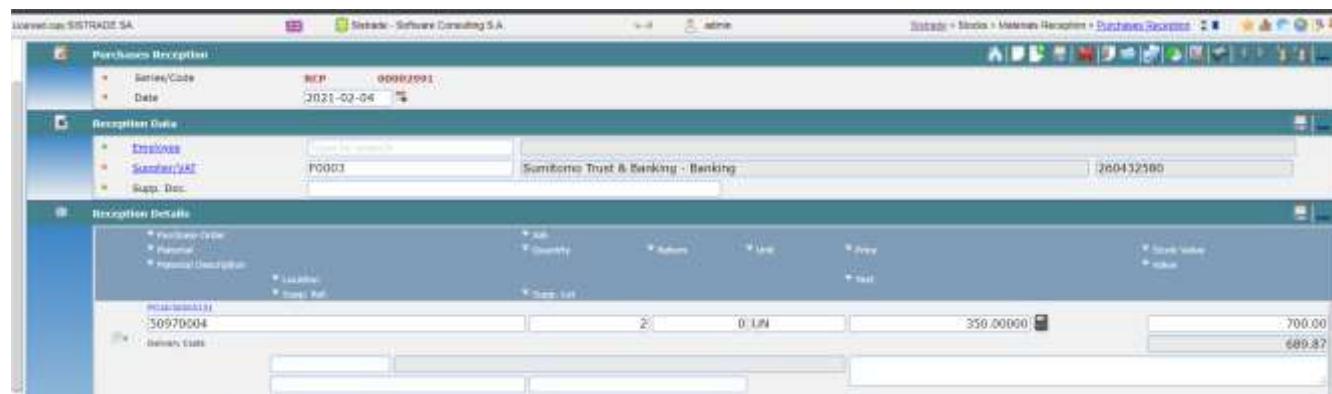

Figure 9 – Purchase reception

To complete this document, the user should define/confirm the purchase order number, supplier document and service/product cost. After saving it, the purchase order status is changed.

There is a possibility to configure in the system a purchase order from to a supplier and delivery to a different supplier. So, to do that the system allows to record the delivery address of the destination supplier in the purchase document.

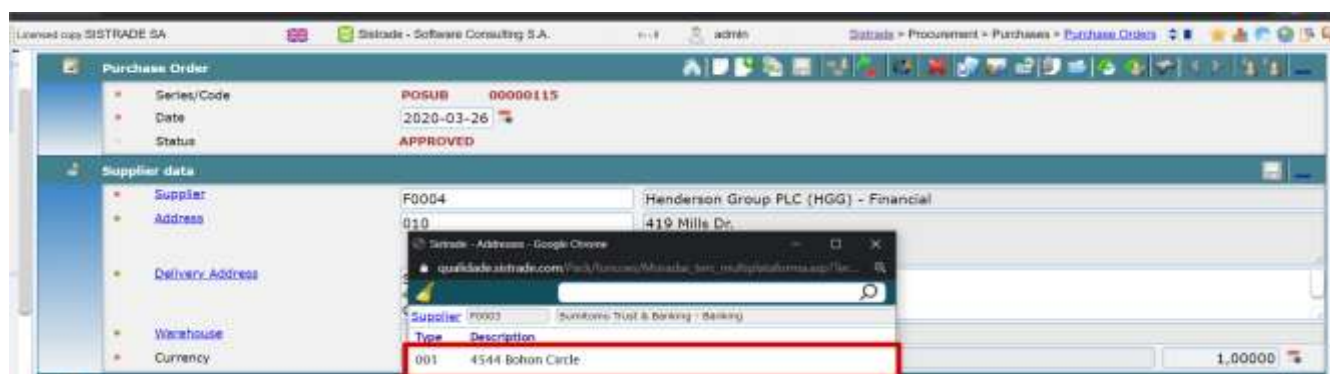

Figure 10 – Service purchase with a different delivery

After, in purchase service reception the documents will be linked to destination supplier.

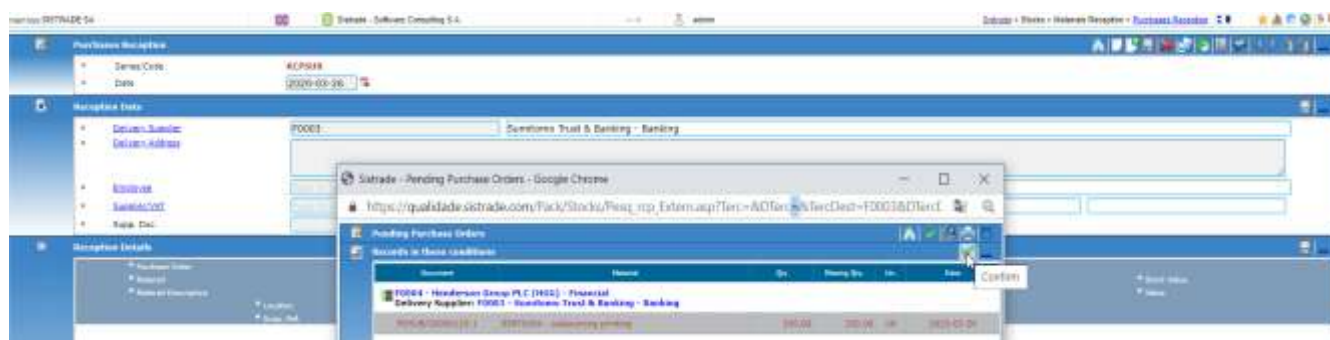

Figure 11 – Service reception with a different delivery

1.7. Material Reception

This type of material reception is associated with purchase material that has stock control. To register this type of movements in the system, the user must access the menu option: Sistrade > Stocks > Materials Reception > Material Reception

Figure 12 – Material reception

To complete this document, the user should define/confirm the purchase order number, supplier document, warehouse for material entry and quantities to register in stock. Here, its possible to define the number of packages to receive (if the material allows packages control defined in the rule), the quantity of each package and package reference.

After saving this document, the system registers a new stock entry in the system and purchase order status is changed. At last, there is generated a set of labels to paste in each package.

1.8. Available stock

There is a report that allows the user to view the current stock, the reserved stock, the stock requested, order the available stock and the stock of a family of user-specified base article.

The results of the applied filters in the previous section are shown in the section "Records in these conditions" those shown in the picture below:

For a customer who does not have the Quality Control module active, there is no justification for separating the current stock between "Current Stock conforming" and "Pending Current Stock". Therefore, under these conditions, the current stock will only be broken down into current conforming stock and current non-conforming stock.

Then, if the Quality Control module is not active, in the menu option "Sistrade> Supplies> Maps> Available Stock", when selecting an item line to consult details of the available stock, the system changes to list only the following columns as current stock:

- Current Stock compliant: sum of the amount of the compliant packages;
- Current Stock Non-compliant: sum of the amount of non-compliant packages (in the case of packages registered as rejected);

If the Quality Control module is active, the system maintains its current behaviour, separating the current stock into:

- Current Stock compliant;
- Current Stock Non-compliant;
- Current Stock Pending;

It is also guaranteed that if the Quality Control module is active and the item under analysis does not have quality control, the system will only show the current stock in "Current Stock compliant" and "Current Stock Non-compliant";

1.9. Supplier Invoice

After material reception, the next step is supplier invoice registration.

Figure 13 – Supplier Invoice structure

In this document should be mentioned the material reception to invoice, in order to the system link that with purchase order. Can be defined here eventual transport cost and distribute them to the invoice lines and consequently to product value.

After save the supplier invoice document, the stock material is revalued, JOB order costs are revalued- in case of purchased services (outsourcing process) and the document is launched in treasury.

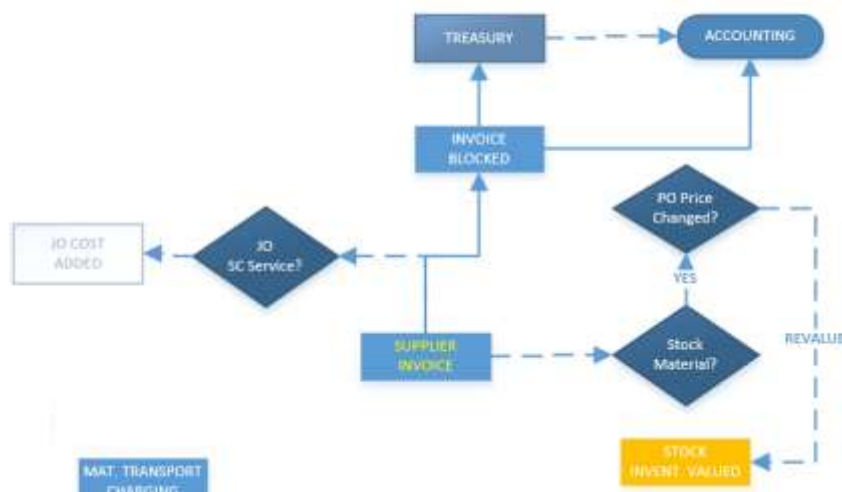

Figure 14 – Supplier Invoice confirmation

1.10. Close Deliveries

This menu option (Sistrade > Stocks > Materials Reception > Scheduled Deliveries) allows the user to search and control all material deliveries from the suppliers and scheduled for a particular date, however have not been delivered to the warehouse.

If a purchase document is not fully received, the delivery can be closed from the scheduled deliveries.

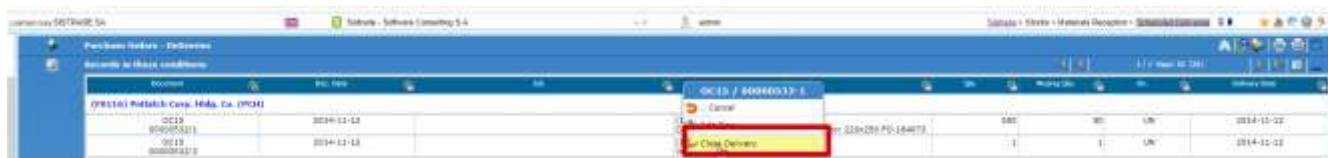

Figure 15 – Close Deliveries

2026
